Diagnosis and treatment of the adrenogenital syndrome in childhood SPORN LEK.

1952, 5/4 (92-119) Tableau Illus. 10

This is a full discussion of the clinical, biochemical, psychosexual and therapeutic problems arising from the adreno-genital syndrome for the pediatrician, surgeon, radiologist, biochemist and gynecologist. For the investigation to assess the size of the adrenals or the presence of a tumour the authors advocate pneumoperitoneal insufflation according to the method of DeGennas-May and Simon, in preference to perirenal air insufflation. Thirteen cases seen between 1945 and 1952 are reported, 12 in girls and one in a boy. The ages ranged from 8 months to 10 yr. Two of the girls were diagnosed as suffering from carcinoma of the adrenal cortex, the others from adrenal hyperplasia. In 4 cases partial resection of one hyperplastic adrenal was carried out, removing approximately half the gland. Though the virilizing process was arrested postoperatively no regression of established clinical signs was noticed.

TITLE:

Reliable hermetic sealing of capacitors type K 677
(Nadezhnaya germetizatsiya kondensatorov tipa K877)

PERIODICAL:

Vestnik Elektropromyshlennosti, 1958, No.2, pp. 76-79 (USSR)

ABSTRACT:

The hermetic sealing of impregnated paper capacitors type K 677 is effected by soldering the metal frame and the conducting wire to the ceramic insulator. Difficulty is experienced in making a good hermetic seal. The temperature conditions of the process of making a joint between the ceramic, the silvering, the solder and the metal are illustrated diagrammatically in Fig.2. This article offers stress-calculations for the metal to ceramic joint for various designs of soldered joint. It is necessary to analyse the operation of capacitors over the range of working temperatures and to calculate the stresses that are set up. Temperature changes cause considerable stresses at the joints, which are between materials of very different coefficients of expansion and elasticity. An expression is derived for the stress at the boundary between the metal and the ceramic. On substituting numerical values, the expression shows that if the capacitor is in an unstressed condition at a temperature of 20°C, then the stress at + 85°C is 44 kg/cm² (compression), and at -80°C 54 kg/cm² (tension). This exceeds the rated stress of the metallised layer, which is 35 kg/cm².

Reliable hermetic sealing of capacitors type K

110-2-21/22

The insulator should be of the section shown in Fig.6, to reduce the tangential stresses set up by cooling. For a reliable joint to the conductor wire, a steel cap may be placed on top of the insulator, preventing damage to the joint at the sharp edge of the ceramic. On the basis of this work, R.A. Rozdova, an Engineer of the Capacitor Factory, selected a new shape of insulator which gave good results in production. The stress at the joint between the casing and the insulator is determined in the same way as that of finding the transverse component of the stress at the joint between the insulator and the conductor. In this case, stresses arise that are tensile on heating and compressive on cooling. Therefore, when testing by means of temperature cycles, hermetic sealing at this joint is intact at low temperatures but can break at high temperatures. The best shape of insulator and joint for connection to the casing is also shown in Fig.6. It is concluded that the existing design and method of joining metal to ceramic in capacitor type K677 does not ensure vacuum tightness, and 5 - 10% of the capacitors fail type-tests. The calculations show that with the present designs the seal between the insulator and the conductor may fail at low temperatures; a formula is given to calculate the best slope of the cone between the insulator and the conductor in respect of thermal stresses.

AUTHOR: Nemchenok, R. L.; Strakovskaya, S. Ye.

TITLE: Emission properties of the gold-barium system

SOURCE: Radiotekhnika i elektronika, v. 9, no. 4, 1964, 761-762

TOPIC TAGS: gold, barium, gold barium system, gold barium cathode emission, gold barium intermetallic compound, gold antiemission property, work function

ABSTRACT: The effect of the heating temperature on the thermionic and photoemission properties of the gold-barium system was investigated in order to obtain data on the antiemission properties of gold. The experimental technique was described elsewhere (A. R. Shul'man, M. L. Kapitza, R. L. Nemchenok, Ye. V. Zelenetskaya, Fizika tverdogo tela, 1960, v. 2, no. 11, 2805). The tests show that in the temperature interval 950-1200 K the evaporated substance is essentially gold. Starting with 1200 K, the evaporation of the Au-Ba layer as a whole begins. The temperature variation of the work function, as obtained from the photoemission data, differs from that obtained from thermionic emission measurements, (see Fig. 1 of Enclosure). This may be due to the evaporation of the

Card 1/3

Title: Special Photographic Camera with Mirror-Lens Objective

Original
Periodical: Tr. Vses. n.-i. in-ta metrologii, 1955, No 26, 75-84

Abstract: Description of photographic camera for photographing an interference pattern and a procedure for adjusting the mirror-lens apochromatic [text in error] asymmetrical objective of the camera. Methods of manufacturing asymmetrical lenses are described and certain investigation results obtained with a camera are given. The optical characteristics of the objectives are: $F = 500 \text{ mm}$, $1:6.3$; field $2\beta \approx 40^\circ$. The visually-observed resolving power of the objectives over the entire field is approximately equal to the rated one (230 lines/mm), and is approximately 200 lines/mm at the center of the field. The minimum resolvable

TITLE:

Application of Polygonal Prisms for Accurate Measurement of Angles in Britain, USA, and France (Primenenie mnogogrannikov pri zem v Anglii, SShA i Frantsii dlya tochnogo izmerenija uglov)

REFERENCE:

"Inzenernaya Tekhnika, No. 5, Sep-Oct 1977, p. 51-52 (USSR)"

ABSTRACT:

Information compiled from foreign literature is presented on application of polygonal prisms in measuring instruments used for indexing in gear cutting, or drilling of holes on a circular line on machine parts. Application of automatic collimators in connection with precalibrated polygonal prisms is considered. The method is considered to be advantageous and speeds up the positioning of a part with the necessary accuracy.

AUTHOR: Strakun, I.I. JOV-115-58-4-7/45

TITLE: Some Problems in the Checking of Spectacles Optics
(Nekotoryye voprosy kontrolya ochkovoy optiki)

PERIODICAL: Izmeritel'naya tekhnika, 1958, Nr 4, pp 18-20 (USSR)

ABSTRACT: An accurate method for determining the refraction of standard lenses to be used for checking the refraction scales of dioptimeters, is described, and a formula is given for finding the refractive index of a lens. Accurate, universal dioptimeters should be used by organizations engaged in the production or checking of spectacles lenses, whereas simpler and less accurate dioptimeters may be used by agencies distributing them to the general public. In this way the standard and accuracy of spectacles lenses issued to the public would be raised.

TITLE: Reproduction and Transmission of an Angle in Standard Measurements

PERIODICAL: Izmeritel'naya tekhnika, 1960, No. 10, pp. 13-15

TEXT: The Sverdlovskiy filial (Sverdlovsk Branch) of the VNIIM (Vsesoyuznyy nauchno-issledovatel'skiy institut metrologii (All-Union Scientific Research Institute of Metrology)) developed a new test scheme for angular measurements. An instruction for the testing of goniometers was edited and published by the VNII Komiteta (Vsesoyuznyy nauchno-issledovatel'skiy institut Komiteta (All-Union Scientific Research Institute of the Committee)), and a horizontal installation was developed for the measurement of angles of polyhedral prisms of the first class. At the VNIIM, an installation was established which warrants the realization of a standard method of reproducing the value of a plane angle. In order to realize this method, two precision autocollimators with telephoto lenses were used as well as three standard prisms of molten

TITLE: Lens refraction measurements and visual lensometers

SOURCE: Izmeritel'naya tekhnika, no. 12, 1966, 12-15

TOPIC TAGS: optic lens, light refraction

ABSTRACT: The principle of measuring refraction of spectacle lenses by means of conventional visual lensometers is explained. The accuracy of measurement depends on the exact setting of the observation mark, aberration, inaccurate lens positioning, etc. Orders of magnitude of possible errors are figured out. A new "coincidence lensometer" developed by Zeiss (E. Germany) with a view of higher accuracy (E. Beuer, Mschr. Feinmechanik und Optic, 80, 3, 1963) is briefly described. Although its higher accuracy is recognized, the new instrument is still based on an subjective method of reading, and an objective method of measurement remains desirable. Orig. art. has: 2 figures and 1 formula.

TITLE: Physical characteristics of the type IRT-2000 swimming-pool
research reactor with loop channels

SOURCE: AN BSSR. Izvestiya. Seriya fiziko-tehnicheskikh nauk,
no. 1, 1965, 8-17

TOPIC TAGS: nuclear research reactor, nuclear reactor component,
nuclear reactor technology

ABSTRACT: The article describes a modified standard reactor which
went into operation at the Institute of Heat and Mass Exchange of
the Academy of Sciences of the Belorussian Republic in May 1962.
The original design was described by V. V. Goncharov et al. at the
second Geneva Conference in 1958 (Trudy II Mezhdunarodnoy konferen-

Card 1/3

L 1996-66

ACCESSION NR: AP5014734

tsii po mirnomu ispol'zovaniyu atomnoy energiee, v. 2, Atomizdat, 1959) and elsewhere. Since the original design made no provision for test loops, the authors describe the changes in the construction of the individual units of the reactor at the location where the loop was installed, the differences arising in the physical characteristics, experimental investigations of the physical characteristics, experimental investigations of the physical characteristics of the modified reactor, including the new critical experiments (performed by Yu. G. Nikolayev of the I. V. Kurchatov Institute of Atomic Energy), and the main results. The latter have shown that installation of a loop channel with approximately 3 kg of steel is feasible, and that optimal materials surrounding the loop channel can be chosen so as to make possible either a maximum run or a maximum flux of thermal neutrons. At a power of 2000 kW the attainable neutron flux is 10^{14} neutron/cm² sec. Orig. art. has: 5 figures and 2 tables.
